

SUNDAS SALEEM

Senior Software Engineer | Distributed Systems, Backend & AI Infrastructure | Python · Java · C++ · AWS

sundask4.sk@gmail.com · +92 347 241 6097 · Karachi, PK (Remote-Ready) · github.com/sundas-saleem · sundas-saleem.github.io · linkedin.com/in/sundassaleem-8b516879

PROFESSIONAL SUMMARY

Senior Software Engineer with 6+ years building high-throughput, production-grade backend systems in Python, Java, and C++ — including a multithreaded real-time call-routing engine sustaining 2M+ interactions/day, Kafka event pipelines, AWS serverless orchestration, and Spring Boot microservices. Built reusable frameworks adopted as engineering-wide standards: an OpenTelemetry instrumentation library across 10+ microservices and test automation achieving 95% production coverage. More recently, led AI agent development using Anthropic and OpenAI APIs, designing MCP server orchestration and human-in-the-loop workflows. Comfortable owning architecture end to end, driving engineering standards, and shipping across distributed, async environments.

SKILLS

Backend & Systems: RESTful APIs, microservices, event-driven architecture, Kafka, gRPC, high-throughput services, concurrency & multithreading, fault tolerance

Cloud & Delivery: AWS (Lambda, serverless, Amazon Connect), Docker, Kubernetes, CI/CD, GitHub Actions, OpenTelemetry, Prometheus, Grafana

AI & Agents: AI agent development, MCP server design, LLM integration (Anthropic & OpenAI APIs), RAG, human-in-the-loop workflows

Languages: Python, Java, C++, C#, TypeScript, Node.js, SQL

Databases: PostgreSQL, MySQL, Redis, Kafka

Real-Time & Voice: SIP, Twilio, Five9, Avaya, Genesys, NICE inContact, Amazon Connect, WebSocket, TCP, gRPC

EXPERIENCE

Senior Software Engineer | Afiniti, Pakistan | Jan 2025 – Jun 2026

Owned backend architecture for enterprise real-time telephony platforms — microservices on AWS, Kubernetes, and Docker — and led AI agent adoption for engineering automation.

- ◆ Reduced critical production incidents by ~90% by redesigning a single-threaded C++ call-routing service into a multithreaded architecture, sustaining 2M+ calls per day with zero downtime.
- ◆ Built a real-time analytics platform with Kafka processing 2M+ events per day, plus AWS Lambda orchestration services propagating agent configurations and routing profiles across distributed environments.
- ◆ Led end-to-end ownership of 4 production microservices for real-time voice — switch interface, SIP call dialing, telephony orchestration, and QA validation — each serving multiple enterprise clients.
- ◆ Architected a reusable OpenTelemetry instrumentation library adopted across 10+ microservices — cutting troubleshooting effort by 70% through distributed tracing.
- ◆ Designed a multi-agent AI system on Anthropic and OpenAI APIs — PR review, code review, Jira, and log-analysis agents orchestrated via MCP servers — defining agent abstractions and human-in-the-loop workflows other engineers built on.
- ◆ Drove code reviews, engineering standards, and mentored 2 junior engineers, shaping API conventions and design practices across the platform.

Software Engineer | Afiniti, Pakistan | Oct 2021 – Jan 2025

Designed and delivered backend services, test automation, and real-time telephony integrations used across engineering teams.

- ◆ Designed REST APIs and integrations for Twilio, Five9, Avaya, and NICE inContact — cutting integration defects by 40%.
- ◆ Built Java test automation with Selenium WebDriver and high-scale load testing framework simulating 100+ concurrent agents and 1M+ calls end-to-end — achieving 95% production coverage before every release.
- ◆ Built a Python log analytics platform automating diagnostics of production telephony workflows — improving incident resolution efficiency by 45%.
- ◆ Developed automated testing frameworks in Java, C++, Python, C#, and Node.js, reducing manual testing effort by 50% and accelerating release cycles by 20%.

Analyst Software Engineer | Afiniti, Pakistan | Dec 2019 – Oct 2021

Built telephony integration, automation, and validation platforms adopted as engineering-wide standards.

- ◆ Built a telephony platform in Java Spring Boot integrating multiple third-party providers behind unified REST APIs.
- ◆ Designed a Node.js simulation platform supporting REST, TCP, and WebSocket protocols for end-to-end validation of distributed real-time communication workflows.
- ◆ Built a distributed C++ integration testing platform with near-complete microservice coverage — cutting defect escape rate by 95%.
- ◆ Delivered reusable automation frameworks in C++, Python, Java, and C# adopted as engineering-wide standards, reducing regression effort by 95%.

EDUCATION

Bachelor of Science in Software Engineering · NED University of Engineering & Technology, PK · 2015 – 2019
